genome polyprotein - human poliovirus 3 (strain Sabin vaccine
P3/Leon/37, P3/Leon/12a[1]b)
coat protein VP1; coat protein VP2; coat protein VP3; coat
protein VP4; core protein P2-3b; core protein P2-5b; core
protein P2-X; genome-linked protein VP9; probable
proteinase P3-7c; protein P3-1b; protein P3-2; RNA-directed
RNA polymerase (EC 2.7.7.48) P3-4b
#formal_name human poliovirus 3

C -: FUNTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN

Q/G SITES IN THE POLYPROTEIN. IT MAY BE A CYSTEINE PROTEASE.

C -: FUNTION: P3C POLYPEPTIDE IS COMPOSED OF 60 ICOSAHEDRAL UNITS,

C -: FUNTION: P3C POLYPEPTIDE IS COMPOSED OF FOUR PROTEINS VP1, VP2

VP3, AND VP4.

C -: SUBDNIT: THE VIRUS CAPSID IS COMPOSED OF PROTEINS VP1, VP2

VP3, AND VP4.

Strain genome.";

PROC. NATL. ACAD. SCI. U.S.A. 79:5793-5797(1982).

-!- FUNCTION: P3C POLYPEPTIDE IS A PROTEASE IHAT CLEAVES AT CERTAIN

C -!- FUNCTION: P3C POLYPEPTIDE IS COMPOSED OF 60 ICOSAHEDRAL UNITS,

EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2,

VP3, AND VP4.

-!- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS.

C -!- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS.

C -!- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS.

C -!- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROCESS.

C -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY C3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MYRISTYLATION

X-RAY CRYSTALLOGRAPHY (2.4 ANGSTROMS) OF 1-878.

SUBDITTED (MAR-1995) TO THE PDB DATA BANK.

C. !- FUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN

C. !- SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS,

EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2,

C. !- PIM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS.

C. !- THE STRAIN SABIN VACCINE P3/LEON/37 IS SHOWN.

C. !- THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PROGENITOR OF THE STRAIN SABIN VACCINE P3/LEON/37 IS THE PAGE SABIN VA

C -!- FUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN

C -!- FUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN

C -!- FUNCTION: P3C POLYPEPTIDE IS COMPOSED OF 60 COCOSHEDRAL UNITS,

E BACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2,

VP3, AND VP4.

PIW: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CORE PROTEINS

SCIENCE 270:397-403(1995).

-!- FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN BNZYME RESPONSIBLE FOR MOST OF THE REPLICATIVE SYNTHESIS IN BACTERIA.

THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXONUCLEASE ACTIVITY.

THE ALPHA CHAIN IS THE DNA POLYMERASE (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: N DEOXYNUCLEOSIDE TRIPHOSPHATE = N PYROPHOSPHATE + DNA(N).

-!- SUBCELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).

                                                                                                                                       PROTEINS
                                                                          CERTAIN
       HUGHES P.J., NORTH C., MINOR P.D., STANWAY G.;

"The complete nucleotide sequence of coxsackievirus A21.";
J. GEN. VIROL. 70:2943-2952(1989).

-!- FUNCTION: IT IS THOUGHT THAT THE P2C PROTEIN ATTACHES TO VESIC
MEMBRANES AND IS ASSOCIATED WITH VIRAL RNA SYNTHESIS.

-!- FUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAL
O/G SITES IN THE POLYPROTEIN. IT MAY BE A CYSTEINE PROTEASE.

-!- SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS,
EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VI
VP3, AND VP4.

-!- PIM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEIN
-!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY C3.
                                                                                              SEIND
                                                                                                              \mathrm{VP1},
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CLAYTON R.A.,

SCIENCE 261:50-58(1993).

-!- FUNCTION: MUSCLE CONTRACTION. MYOSIN IS A PROTEIN THAT BINDS TO F-- FUNCTION: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)

-!- SUBCELLULAR LOCATION: THICK FILAMENIS (MLC-2).

-!- SUBCELLULAR LOCATION: THICK FILAMENIS OF IHE MYOFIBRILS.

-!- DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.

-!- PTM: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKILATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

-!- PTM: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKILATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

-!- EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LMM) AND 1 HEAVY MEROMYOSIN (HMM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED SUBFRAGMENT (S2).

-!- SIMILARITY: THE PERIODICITIES OF HYDROPHOBIC AND CHARGED RESIDUES, WHICH DICTATE THE ALPHA-HELICAL COILED-COIL STRUCTURE ARE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL; M16557; G212372; -.

The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: (1) an antibody purified from biological fluid or cells of organisms administered with the carbohydrate peptide conjugate, and (2) a diagnific comprising antigen-specific antibodies elicited by immunisation the carbohydrate peptide conjugate. The peptide conjugate, antibody diagnosis kit are used to provide pharmaceutical compositions and vaccines against tumours. These can be used to support an immune resagainst viral infections caused by hepatitis virus, HIV or cytomegal virus. They can be used to enhance immune responses, especially B-

this
rne sequence is that of amino acids 23-128 of policapsid polypeptide (see N90247). The peptide is rantibody C3. It is useful as a reagent for detectianti-poliomyelitis antibodies, and as a component It contains the necessary antigenic determinants, enough to be synthesised chemically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pe

R New vaccine against infectious polio-virus comprises RNA virus.

T for producing RNA virus cDNA and viable RNA virus.

T for producing RNA virus cDNA directs the prodn. of a viable collovirus obtd as in Q22965. The cDNA directs the prodn. of a viable collovirus which is phenotypically similar to the source virus.

C The full length cDNA in pLED3 was infectious. In vitro consocribition of pLED3 cDNA using T7 RNA polymerase produced contrass which possessed several erroneous amino acids. The RNA viruses are used in vaccines against polio. The screening method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     virus

Novel Streptococcus pneumoniae proteins and related DNA - useful for diagnosing anti-microbial agents for treatment of bacterial diagnosing anti-microbial agents for treatment of bacterial claim 12; Page 350; 483pp; English.

Claim 12; Page 350; 49 proteins of particular the proteins of the invention can be used to identify antimicrobial compounds which are capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal inplantation of in-dwelling devices or other than by the inplantation of in-dwelling devices or other surgical techniques.
                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             \ddot{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Streptococcus pneumoniae protein of unknown function.
Streptococcus pneumoniae protein; genetic immunisation; antagonist; immunological response; inoculation; antibody production; inhibitor; T cell immune response; antimicrobial compound; bacterial adhesion; extracellular matrix protein; protein-mediated cell invasion; wound; pathogenesis.
Streptococcus pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

ig
can be used during amplification of the source virus for vaccinal prodn. to ensure maintenance of C at position 2493 in the viral genome i.e. increasing the attenuation. The new prod. overcomes the problem of errors introduced during replication of ss RNA, which is much higher than for ds DNA.

Sequence 2206 AA;

Toledo strains, used to develop prods. for the diagnosis, prevention and treatment of human CMV infections

Toledo strains J Page 85-88; 150pp; English.

Novel protein UL150 (W05519) is the product of an open reading frame found in a novel nucleic acid (T41418) isolated from the Toledo strain of human cytomegalovirus (HCMV). UL150 and other novel (see also W05502-20) and known (see also W05500-01) proteins of the Toledo strain, as well as new proteins (see also W05521-24).

Tom HCMV Towne, can be produced in transformed host cells and used

Example 1; Page 86-87; 141pp; English.

This sequence is encoded by a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as this protein sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate

Detecting a curry prostate cancer

Example 10; Page 89-90; 104pp; English.

This sequence represents the human PS112 protein derived from various gene specific clones isolated from a prostate library and is used in a gene specific clones isolated from a prostate library and is used in a novel method of detecting the presence of a target PS112 polynucleotide in a test sample. The method can also be used to detect mRNA of PS112 ir a test sample. The method can be used for diagnosis of prostate cancer, as the presence of PS112 is an indicator of prostate cancer. Antibodies as the presence of PS112 is an indicator of prostate cancer. Antibodies

Polypeptides comprising immunogenic portions of prostate proused in a vaccine for the treatment of prostate cancer Example 1; Page 81-82; 130pp; English.

The present sequence is an immunogenic portion of a prostate protein. The immunogen, or the DNA encoding it, can be used vaccine for the treatment of prostate cancer. The immunogen isolated from a prostate tumour cDNA library obtained by sublibrary.

The process alanyl-tRNA synthetase from Staphylococcus aureus WCOB 29 - useful for protection against bacterial infections claim 1; Fig 2; 35pp; English.

The present sequence represents a novel alanyl-tRNA synthetase protein from Staphylococcus aureus strain WCUB29 (NCIMB 40771), which is related by amino acid sequence homology to Escherichia coli alanyl tRNA synthetase. Vectors comprising the DNA (or polynucleotides having at synthetase. Vectors comprising the DNA (or polynucleotides having at least 70 % identify to it) can be used for the recombinant production of the enzyme. The enzyme or its related DNA (through gene therapy) is used to induce an immunological response in a mammal to generate carticolates are protect against disease. The antibodies protect against crisue, including wounds in skin or connective tissue caused by mechanical, chemical or thermal damage or by implantation of in-dwelling devices, or wounds in the mucous membranes. Artagonists are used to inhibit the enzyme, especially to prevent adhesion of bacteria to devices or to mammalian extracellular matrix proteins on in-dwelling devices or to extracellular matrix proteins in wounds, or to block tRNA synthetase protein mediated mammalian tyrosine kinase. Analysing a sample for the presence of the enzyme (or a polypeptide having at least 70 % identity to it) is used for a diagnostic process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        im 1; Fig 1; 25pp; Japanese.

s sequence represents a human heart calveolin protein. This protein is sequence represents a human heart calveolin protein. This protein is be used for prophylaxis and treatment of diabetes, obesity, cancer, criosclerosis and muscular dystrophy. Calveolin can also be used for intifying compounds which can promote or inhibit its activity.

Magnetic particles formed in magnetic microbe AMB1, useful for stable prepn. of proteins

Claim 2; Page 9-11; 17pp; Japanese.

The magA protein binds to an organic membrane covering fine magnetic particles formed in the magnetic microbe AMB1, useful for stable protein binds to an organic membrane covering fine magnetic particles formed in the magnetic microbe AMB-1. The magnetic microbe can be used for the stable prepn. of proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

PT magnetic particles formed in magnetic membrane - covering fine magnetic particles formed in magnetic microbe AMB1, useful for proper proper of proteins

PT magneticles formed in magnetic membrane covering fine magnetic complements be seally binds to an organic membrane covering fine magnetic complement of proteins.

PT magneticles formed in the magnetic microbe AMB1, useful for particles formed in the magnetic microbe AMB1. The magnetic microbe can be used for the stable prepn. of proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;
